

FUNBAR STATION®

FUNBAR-Station is developed to meet the new EU directive on enrichment materials in the pen environment and to prevent and reduce tail biting, fighting and ear sucking.

A spring-loaded split-anchor makes it possible to attach the FUNBAR STATION to all types of slatted floor.

Two plastic tails are placed on the FUNBAR STATION to give the pigs an alternative option of activity.

FUNBAR STATION can easily be moved from pen to pen.

FUNBAR STATION was developed together with Vitfoss, who is producing the bars.

FIBER-BAR consists of sphagnum, which is among the most preferred rooting and activity material. Providing rooting and activity material to pigs help to ensure a natural behaviour in the existing breeding systems.

*1 Set Includes:
4 Funbar Stations
20 Bar*

Two plastic cylinders rotate around the middle axis in the FUNBAR STATION. Thereby pigs can activate/move these and it ensures that pig's interest in the toy is maintained. Bars are placed in the two cylinders - choose between mineral bars and fibre bars.

FUNBAR STATION comes with spacers, which can be mounted in order to adjust pig's access to the bars

MINA-BAR is a mineral-bar composed after documented research, including magnesium fumarate as an essential factor. MINA-BAR provides the pigs with supplementary minerals in order to limit unwanted behaviour, such as tail biting and other aggressive behaviour, causing heavy expenditure on the pig breeders.
