

**ULTRAFLEX
VIP farrowing pen system****Innovative solutions for the future...**

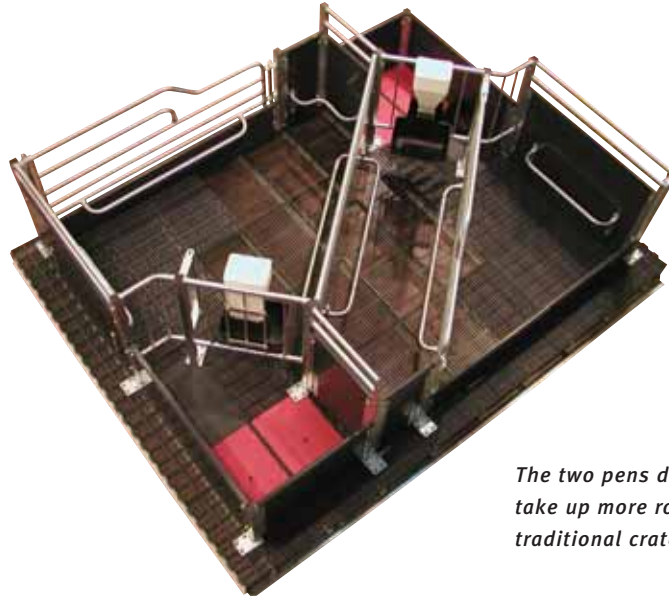

The patented Ikadan farrowing pen allows the sow to move freely. The diagonal partition between the two sections provides the sow with more room to move about, and farrowing rails along the outer walls protect piglets from being crushed.

Several years' experience with VIP farrowing pens for loose sows shows that both sows and piglets thrive and that piglets apparently grow at a faster rate. The Ikadan VIP system is compatible with the Ikadan Ultraflex slatted flooring. For example the floor in the piglet shelter can be equipped with plastic heat pads in order to provide piglets with optimum conditions. The Ikadan VIP system meets current demands for improved animal welfare. Plus, there is no need to build new pig housing, as the system does not require larger areas than traditional crate housing.

SYSTEM**World Wide**

ULTRAFLEX VIP farrowing pen system

The two pens do not take up more room than traditional crates.

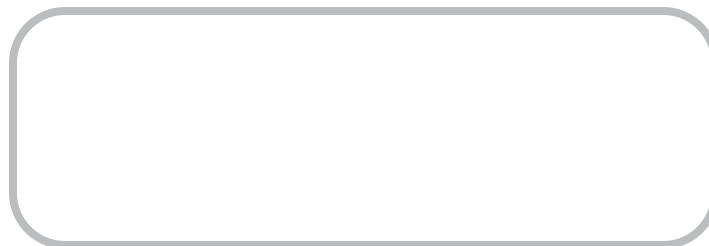

Loose sows produce piglets with a higher weight at weaning.

We have also chosen to incorporate the possibility of restricting the sow for the first few critical days after farrowing. This is achieved by positioning the front gate parallel with the diagonal partition, thus producing a farrowing cubicle that protects the piglets and supports the sow for the first days after farrowing.
