

ULTRAFLEX
partially drained flooring**Innovative solutions for the future...**

As the name suggests, Ultraflex is ultra flexible. Practically any requirement can be met thanks to the modular design, and a combination of plastic and cast iron can be used for partially drained floors. An economically attractive solution where it is possible to achieve the benefits of slatted flooring. Cast iron is used beneath the sow and plastic elsewhere. Supports can be made of fibreglass, galvanised steel or stainless steel as required.

ULTRAFLEX
partially drained flooring

Optimum manure fall-through is ensured by the correct size of aperture between slats.

The triangular slat cross-section gives easy and problem-free cleaning.

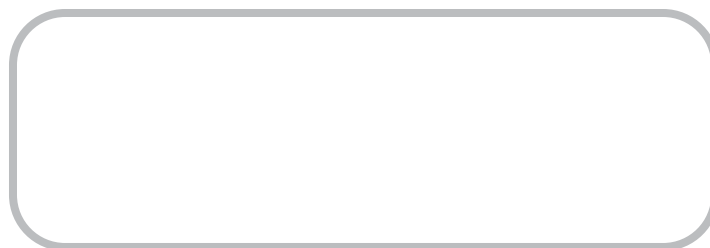

Quick and easy to install.

Special fittings make Ultraflex easy to use, also in housing renovation.
